

BRINE DISPOSAL SUSPENDED SOLIDS REMOVAL

by

V. Ralph Cole, Jr.

ABSTRACT

In any form of operations involved in the development and disposal of brine, several problems are present. This is equally true in oil and gas production as well as solution mining of salt caverns or using the brine for displacement of product. This problem is suspended solids which create well bore and formation blockage of the disposal wells. To remove these suspended solids, several methods have been addressed: settling ponds; filtration, and chemical treatment.
