It is not easy to describe in simple terms complicated salt's problem in this area and not repeat already well known facts. The problem of material's selection appears as well, because it is difficult to choose only the most important and typical issues without losing the essence of the matter. We intend to formulate and depict main problems and their solutions in a popular way avoiding technical academicism and unnecessary statistics. Salt deposit in Tuzla, town located in north-east part of Bosnia and Herzegovina is characterised by small resources, poor quality, complicated tectonics, complex hydrogeological conditions and strong destruction of a rock mass. These factors result in ecological problems. The deposit is situated under north part of the city and extends in SE - NW direction.
